```
This represents a first EcoR1 nucleotide fragment of human KIAA0180. This 5009 basepairs partial CDNA encodes for a protein of unknown function from wpeblast cel line KG-1. The invention provides a human heart O-fucosyltransferase that can glycosylate an epidermal growth factor (EGF) domain of a polypeptide with an activated O-fucose residue. Inhibitors of O-fucosyltransferase, e.g. mutants with increased affinity for the EFG domains, are used in diagnosis and treatment of conditions associated with overexpression of O-fucosyltransferase, to promote survival of sensory (retinal) neurons. Probes based on EGF domain polypeptide are used to detect gene amplification and expression. The expression can also be determined at the protein level using antibodies specific for O-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CyspheGluValAlaAlaGlnArgSerProAspLysLysThrCysProMetLysGluGly 122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell.cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL016176-ABL30513).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0 or more cell-

This invention is related to a novel isolated canine nucleic acid sequences and the construction of canine microarrays containing a significant portion of the canine genome. The isolated canine nucleic significant portion of the canine genome. The isolated canine nucleic coid sequences of the invention may be useful for drug screening and toxicity assays. The invention is therefore useful for assessing the impact, including toxicity, of a compound, pharmaceutical agent or environmental pollutant on a call or living organism. The methods are useful for detecting genes that are up- or down-regulated in canines in a seaful for detect a callular response in a sample individually or as part of a gene expression profile. It is also useful as a target for agents that modulate gene expression or activity. The database is useful for producing electronic Northerns that allow the user to determine the cell type or tissue in which a given gene is expressed and to allow the abundance or expression level of a given gene in a

particular tissue or cell. The methods are useful for determining the similarity of a toxic response to one or more individual compounds. The methods are useful for predicting at least one toxic response or the likelihood that a compound or teet agent will induce various specific pathologies such as those of the liver (liver necrosis, fatty liver disease, protein adduct formation or hepatitis), those of the kidney, theart, brain or testes, or other pathologies associated with at least of the toxins. The methods are also useful for predicting or elucidaring the potential callular pathways influenced, induced or modulated by the compound or test agent due to the similarity of the expression profile compound or the profile induced by a known toxin. The present sequence is that of a canine phy sequence which was claimed for use during the production of a canine microarray of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  217

AMD07571-AAD07645 represent cDNAR corresponding to 25 human secreted protein genes, and AAE03052-AAE0316 represent the proteins they encode. AAE03127-AAE03150 represent human secreted protein fragments. The genes and their corresponding secreted proteins fragments. The genes can their corresponding secreted proteins are useful for preventing, retaining to amelicating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the presence of mutations in the new genes. Specific uses are described for each of the matter in the new genes. Specific uses are described for each of the mitted developing products for the diagnosis or treatment of an include developing products for the diagnosis or treatment of an include developing products for the diagnosis or treatment of abnormalities, haematopoietic disorders, diseases of the immune system, abnormalities, haematopoietic disorders, diseases of the immune system, and include disorders, schizophrenia, asthma, skin disorders disorders disorders, schizophrenia, asthma, skin disorders disorders, angiogenic disorders, kidney disorders, and disorders and also be used to and wound healing and event by and appropriate disorders and also be used to and wound and disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    occurring L-amino
focetal abnormality; developmental abnormality; haematopoietic disorder; immune system disorder; ALDS; autoimmune disease; rhematoid arthritis; inflammation; allaery; neutrological disorder; Alzheimer's disease; Parkinson's disease; cognitive disorder; schizophrenia; asthma; stim disorder; psoriaais; sepsis; diabetes; artherosclerosis; cardiovascular disorder; anglogenic disorder; kidney disorder; gastrointestinal disorder; anglogenic disorder; kidney disorder; ene endocrine disorder; infection; wound healing; vulnerary; cell culture; chemotaxis; food additive; binding partner identification; chromosome 3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids encoding 25 human secreted polypeptides, useful for preventing, disposing and/or treating e.g. Gaucher's disease, Alzheimer's disease, Scimitar syndrome, Creutzfeldt-Jacob disease, diabetes mellitus and multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                 forduct = "Human secreted protein precurs forance | Post-4. 6, as.Xaa) | fransl except= (pos.10. .12, as.Xaa) | fransl except= (pos.10. .12, as.Xaa) | fransl except= (pos.13. .15, as.Xaa) | fransl except= (pos.42. .444, as.Xaa) | fransl except= as.Xaa | fransl except= as.Xaa | fransl except= (pos.42. .444, as.Xaa) | fransl except= (pos.44, as.Xaa) | fransl except= as.Xaa equals any of the naturally o acids; CDS does not include start codon"

primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemctaxis, and can be used as a food additive or preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein-encoding CDNA of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             345

                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    nPropheGlyProPheTrpAspGlnPheHisValSerPheAsnLysSerGluLeuPheTh 143
                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABD72072). The sequence data for this patent did not form part of bring printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                         à
                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAKE4951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have eytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polymuclectides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polymuclectides may be used to produce the secreted (I), by inserting the concleic acids into a host cell and culturing the cell to express the diagnose and treat immune/haematopoietic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic derived cells. AAK64703 cancers and cancer metastases of haematopoietic derived cells. AAK64703 represent human immune/haematopoietic antigen genomic sequences from the present invention. AKM54942 to AAK64950 and AAM93169 represent success and in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GlnCysValGlyTyrSerArgSerThrAlaAlaProLeuThrMetThrMetCysLeuPro 262
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acide encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Disclosure; SEQ ID NO 34727; 3071pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 10331 BP; 2718 A; 2405 C; 2599 G; 2609 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        10331

```
Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a genomic sequence encoding a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Other

The invention relates to an isolated polymuclectide comprising any one of 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was determined by the technique of SBH (sequencing by Mybridisation). Also included is a purified polymeptide comprising a sequence corresponding to a reading frame of the novel polymuclectide. The nucleic acid sequences are useful in diagnostics as expressed sequence tags (EST) for identifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations in forensics, in assessing biodiversities, or in identifying mutations crapponsible for genetic disorders and other traits. The nucleotide responsible for genetic alsorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of is useful for generating antisense DNA or RNA. The purified polypeptide is one of the 38043 isolated cDNA/EST sequences. Note: The sequence data for this patent did not form part of the printed specification, but was contained in electronic format directly from USPTO at equation of the command in electronic format directly from USPTO at equation of the SPTO at this process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynuclectide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA.
                                                                                                                                                                                    Human; ss; sequencing by hybridisation; SBH; expressed sequence tag; EST; genome mapping; biodiversity; genetic disorder.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

1. (bases 1 to 1141)

1. (contact: Genoscope consister, Meb. 91057 EvRY cedex - FRANCE Email: seqref@genoscope.cns.fr. Web: www.genoscope.cns.fr. Benish: seqref@genoscope.cns.fr. Web: www.genoscope.cns.fr. st. strand cDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and EcoR V sites of the pCMVSPORT 6 vector. Library was normalized. Library was constructed by Life Technologies, a division of Invitrogen. This sequence belongs to sequence cluster

EST project with full-length enriched cDNA libraries carried out in Animal Genome Research Program (Japan) by National Institute of Agrobiological Sciences and STAFF-Institute

Single pass sequencing of clones derived from oligo-capped cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vector sequences were eliminated by RepeatMasker version 2002/07/13 and crossmatch version 0.990319

Low quality bases were trimmed based on the quality values.

1st strand CDNA was primed with a Not1-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and ECCR V sites of the provisors of everor. Library was normalized. Library was constructed by Life Technologies, a division of Invitrogen. This sequence belongs to sequence cluster For more information about this cluster, see http://www.genoscope.cns.fr/cdna?s=CSOAJOOBDCO6CPI&c=9980.f.

1 st strand cDNA was primed with a NotI-014go(dT) primer. Five prime
end enriched, double-strand cDNA was digested with Not I and cloned
into the Not I and EcoRV sites of the pCMVSPORT 6 vector. Library
was not normalized. Library was constructed by Life Technologies, a
division of Invitrogen.

This sequence belongs to sequence cluster 9980.f

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
